The Chinese steel industry is an issue that elicits many interesting economic questions. My research will analyze the relationship between the quantity of Chinese steel imports and domestic prices for equivalent steel products in an effort to both ascertain the relationship and to emphasize the importance and relevance of understanding the structure and operation of the Chinese steel industry. Among the topics that will be explored are an overview of the structure, organization, and operation of the Chinese steel industry itself, production process inputs and outputs, financial and currency factors, effects of the industry on international trade and global competition, and environmental implications.
