Several studies have been conducted on homosexual earnings over the past 15 years. Most all of these conclude that homosexuals males earn less than their equal heterosexual counterparts and that a homosexual female earns a significant premium to their otherwise equal heterosexual female colleagues. This study involves investigating total household income for homosexual couples versus heterosexual couples and suggests reasoning behind the findings. These explanations will include education level and number of members that work in the household, data to support the findings has been collected from the 2009 American Community Survey executed by the United States Census Bureau.
