Department of English and Linguistics
Indiana University-Purdue University Fort Wayne

The purpose of this paper is to examine the attitudes, perceptions, and knowledge of males and females in regard to the researched paper. To answer this question, we used a primary survey to gather data as our primary method. We also looked at previously published studies to formulate a foundation for our findings. The results of this study indicate that while males and females share similar knowledge about the researched paper, their perceptions and attitudes for a majority of the researched paper are vastly different. This study has several implications; the largest implication is that we must continue to teach the researched paper, but we must also continue to do more in-depth research in this area. Teachers and the public on all levels will greatly benefit from more published academic research in this area.
